Meeting Notes 01.07.2026 refined

Scope & MVP Priorities

- No user management for now; first priority is MVP data upload
- System will be built for an internal network, so no encryption or user management is needed
- Only two epics defined so far (per Adam): Data Entry first, then Data Visualization

Technical / System Behavior

- If the server crashes, data must be saved either completely or not at all. No partial saves.
- UI: white theme
- UI must be easy to maintain and work well with our existing frameworks. If something looks good but is too complex, it gets dropped regardless.
- Data is stored permanently / forever
- Both English and German must be supported as languages

Student & Exam Data Model

- When an exam record is finalized, it must include: First Name, Last Name, Matrikelnummer (student ID), study program, semester
- Multiple exam attempts possible for a single course
- If an exam is repeated, only the best grade is stored
- Grades are simple floats/doubles (decided)
- A student's study program can change (e.g. if the first exam was under "WInf" and a later one under "IMIT", these are study program abbreviations); this should be flagged/shown in red
- If a user's name changes for a given Matrikelnummer, a warning should be shown, then the record is updated

Data Quality & Import Handling

- Need to define which data could be stored incorrectly. Absence codes ("T A" / "A T": did not attend the exam, and "N E": sick note submitted for the exam) should not be counted/considered as valid results here
- If a new abbreviation/acronym appears during import, the system should ask whether to accept it; once accepted, it's applied automatically to future imports

Course Management

- Course names/numbers are not unique, and names may be abbreviated; full name should be shown on hover
- New courses should be addable; further details not important right now, maybe later
- Courses with 8 vs. 6 credits are treated as different courses even if otherwise the same

Override Handling

- Not yet decided

Analytics & Views

- Goal: track whether courses get easier or harder over time
- Analysis views only per semester, not per course (possible overlap/conflict with the course filter below, flagging this, not resolved yet)
- Filter by semester
- Filter by course, showing the best grade achieved
- Metric: percentage of 5.0 grades vs. students who passed
- Metric: average grade among students who passed
- Students with no exam activity for 4+ years should no longer appear in the overview
- Master's/Bachelor's theses are not recorded in the system; possibly shown separately, to be discussed later

Student Scope / Process Coverage

- Only courses offered by "the department" (Bereich) are relevant, not courses from other departments, so a student's full academic path can't be mapped 1:1 anyway

- Primary focus: students from the department / Master's in Software Engineering, but all students who took an exam should be tracked
- Detailed/in depth evaluation is mainly intended for Software Engineering students, for example
